Directions to Authors upon the Preparation of Papers

PAPERS must be typewritten on one side of the paper only and double-spaced, and submitted in duplicate with two sets of figures. In addition to the full title of the paper, authors should supply a 'running title' which will appear at the heads of the pages. Brain does not publish preliminary reports of work in progress: only exceptionally does it publish detailed studies of a single case. Papers reporting experiments on patients or healthy volunteers must record the fact that the subjects' informed consent was obtained (Declaration of Helsinki: Brit. Med. J. 1964, 2, 177). The typescript should be carefully and finally revised before submission to the Editor, so that if the paper is accepted it is ready for the printer. Clarity of style and brevity of expression are essential. Before submitting a paper it is always valuable to obtain the comments of colleagues who are unfamiliar with the work. We refer intending authors to the Journal of Physiology's 'Suggestions to Authors' free of charge from Cambridge University Press, Shaftesbury Road, Cambridge CB2 2BS.

The paper should be accompanied by a declaration in the following terms: 'The work reported in the attached paper entitled ... has not been, and is not intended to be, published anywhere except in Brain.'

BIBLIOGRAPHIC REFERENCES should be limited to essential literature; they should be listed at the end of the paper in alphabetical order, and not numbered. In the case of a Journal: author's name, date of publication in brackets, are followed by the title of the paper, the name of the Journal in full and underlined for italics, the volume number and the first and last page numbers of the paper quoted, both in Arabic numerals. In the case of a book: author's name, date of publication in brackets, title of book underlined for italics, place of publication, publisher's name, chapter and page numbers in Arabic numerals. Works by the same author should be given in chronological order, and if there be more than one in a year, they are marked a, b, c, etc.; when an author's name recurs a short line is used. In the text numbered references are not used, but the author's name is followed by the appropriate year in brackets.

ILLUSTRATIONS should, where possible, be line drawings in Indian ink on separate white boards, numbered, and with the author's name on the back. Drawings and other illustrations should not exceed twice the size of the reproduction and thus lines must be thick enough to show up after reduction. Lettering and numbering should be inserted in pencil on the drawing, or in ink on a transparent overlay, so that professional lettering and numbering can be substituted. Legends should be on separate sheets and numbered. Desired positions of tables and figures should be marked by writing instructions enclosed within lines and brackets, e.g. (Table 3 near here) or (Fig. 4 near here).

Half-tone photographs must be kept to a minimum. Excellent photographs with clear contrast are essential, especially for the reproduction of electron micrographs. Authors may be asked to contribute to their cost. There should be a bar on all micrographs giving magnification, e.g. 1 μm.

Authors are asked not to reprint their papers, or to authorize others to do so, without first consulting the Oxford University Press (Academic Division), Walton Street, Oxford, OX2 6DP.

HISTOLOGY AND HISTOPATHOLOGY OF THE NERVOUS SYSTEM compiled and edited by Webb Haymaker, NASA Ames Research Center, Moffet-Field, California, and Raymond D. Adams, Harvard Medical School, Boston, Massachusetts. (37 Contributors) This monumental work, the descendant of Penfield's Cytology and Cellular Pathology of the Nervous System, covers all facets of nervous system histology and histopathology. A mere sampling of the pertinent topics discussed includes anterior pituitary, hypothalamo-neurohypophysial system, pineal gland, eye, interferon, leukodystrophies, and degenerative diseases. Artfully produced of the highest quality materials, the two volume set comes complete with slipcase. '81, 3520 pp. (6 3/4 x 9 3/4), 1816 il. (13 in color), 16 tables, about $295.00. Two volumes in slipcase.

CORRELATIVE NEUROSURGERY (3rd Ed.) edited by Richard C. Schneider, Univ. of Michigan, Ann Arbor, Michigan. (32 Contributors) The Third Edition of this text comprehensively covers current, correlative neurosurgery. A sampling of chapter topics includes evoked potentials, gliomas, hypothalamic tumors, meningiomas, metastatic tumors, radiation therapy, chemotherapy, basal ganglia disorders, pituitary lesions, hydrocephalus, spine and spinal cord tumors, cervical disease, and congenital anomalies. Beautifully designed with obvious craftsmanship, the two volume set comes complete with slipcase. '81, 1808 pp. (8 1/2 x 11), 1330 il., 70 tables, about $225.00. Two volumes in slipcase.

New! CEREBRAL HEMODYNAMICS IN MAN AND MONKEY: Some Considerations in Cerebrovascular Disease, Subarachnoid Hemorrhage, and Intracranial Pressure by Byron M. Bloor, Loyola Univ. Medical Center, Maywood, Illinois. This book presents clinical and experimental data on cerebral hemodynamics collected by a single investigator using a single technique: indicator dilution. Particular attention is given to the effect of cerebral hemodynamics of perfusion and intracranial pressure, carotid stenosis and occlusion, and subarachnoid hemorrhage. Primate studies involving normal cerebral blood flow, sympathetic stimulation, increased intracranial pressure, and the non-autoregulating vascular bed (posthypoxia) also are reported. '81, 132 pp., 62 il., 22 tables, $19.75

New! FUNDAMENTALS TO A PHARMACOLOGY OF THE MIND by Corneliu E. Giurgea, Univ. of Louvain, Louvain, Belgium. This text explores current concepts of brain functional organization and experimental neuroses; experimental functional physiopathology of higher brain integrative activity; ways in which the functional state of the telencephalic, higher brain integrative structures modulate drug efficacy; and ways in which drugs affect higher brain functions. Other topics covered include the status of nootropic research and the selective telencephalic impact of drugs, ontogenetic and environmental modulations in psychopharmacology, and possible future research directions. '81, 376 pp., 104 il., 20 tables, $37.75

British Journal of Psychology

The British Journal of Psychology, edited by Max Coltheart, Birkbeck College, London, reports mainly on empirical studies likely to bear on the understanding of general psychology. Review studies and short progress reports are also included.

Selected contents of Volume 71 (1980)

M. W. Eysenck & H. J. Eysenck. Mischel and the concept of personality
A. W. Staats. ‘Behavioural interaction’ and ‘interactional psychology’ theories of personality: Similarities, differences and the need for unification
S. Folkard & T. H. Monk. Circadian rhythms in human memory
O. L. Zangwill. Kenneth Craik: The man and his work
C. O. Fraser. Measurement in psychology
P. H. K. Seymour & W. L. N. Moir. Intelligence and semantic judgement time
D. G. Williams. Effects of cigarette smoking on immediate memory and performance in different kinds of smoker
S. Folkard. A note on ‘Time of day effects in school children’s immediate and delayed recall of meaningful material’ — the influence of the importance of the information tested
D. Godden & A. Baddeley. When does context influence recognition memory?
S. F. Walker. Lateralization of functions in the vertebrate brain: A review
G. H. Bower & G. Clark-Meyers. Memory for scripts with organized vs randomized presentations
P. H. K. Seymour. Semantic and structural coding of the months
P. Naish. Phonological recording and the Stroop effect
N. Kapur. Recognition of word associates in semantic paralexia
K. Millar, B. C. Styles & D. G. Wastell. Time of day and retrieval from long-term memory

Neurological Anatomy in Relation to Clinical Medicine

A Brodal

Neuroanatomists have long awaited the third edition of this classic text, unique in its field. Professor Brodal spent several years completing a painstaking review of the research literature and incorporating the recent findings in a fully documented, yet readable, critical analysis. In a lively, narrative style, he discusses anatomical structures in a way that promotes understanding of their functions, often presenting clinical and behavioural data to help reveal these functions. Although its framework remains unchanged, the text has been considerably expanded, reflecting the enormous increase in new knowledge of neurobiology during the past decade. Abundant illustrations, nearly double the number in the previous edition, enhance the text.

'The author has maintained a balance between clinical and scientific content which will ensure the continued importance of the book to all who require information about the human nervous system.' The Lancet.

'Professor Brodal is to be congratulated on his selection of material, and on the method of presentation, which is both clear and concise.' British Journal of Hospital Medicine.

From reviews of the second edition.

Third edition 900 pages 205 illustrations £25

Oxford University Press
The Doctrine of the Nerves
Chapters in the History of Neurology
John D. Spillane
The first part of this fascinating survey of important stages in the history of neurology makes use of previously unavailable translations of the works of Galen, Vesalius, and Willis to illuminate the beginnings of the discipline. The second and third parts discuss developments in the eighteenth and nineteenth centuries, and include a substantial section on the birth of American neurology. Illustrated £25

Wolff's Headache and other Head Pain
Donald J. Dalessio
'The edition has successfully integrated contemporary advancements with the detailed and valued observations of the original author. . . . I would highly recommend the book as a reference for all medical libraries as well as for the practitioner who desires a logical classification and understanding of pain and headache management.' Journal of the American Medical Association. Fourth edition Illustrated £25

Cluster Headache
Mechanisms and Management
Lee Kudrow
This first complete review of cluster headache provides the clinician with a descriptive account of the attack, and details all clinical aspects of the disorder. Although the pathogenesis is unknown, the author concisely sets out the results of recent research into the pathophysiology, and describes the latest and most effective treatment regimens. Illustrated £12.50

Psychological Models and Neural Mechanisms
An Examination of Reductionism in Psychology
Austen Clark
This book offers a systematic account of the reduction of psychological models to neural mechanisms. It will interest philosophers, psychologists, and anyone investigating the relation between our knowledge of physiology and models of behaviour in experimental and abnormal psychology. £11.50

Oxford University Press
